SUPERIOR ROLL HANDLER

The forks and battery compartment of your pallet truck is completely apart. Reinforcement plates are added and the battery compartment along with the forks are widened to the correct width.

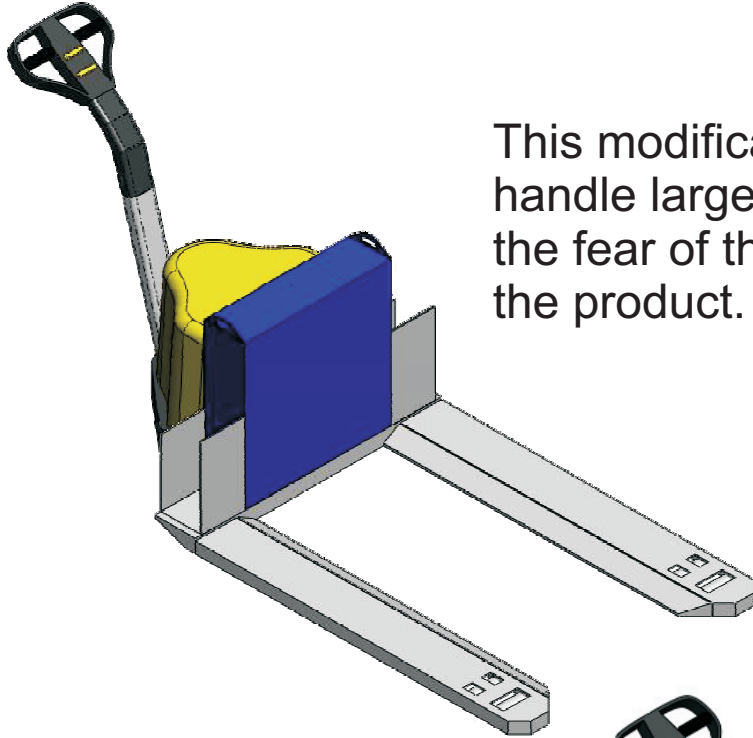

The linkage is reassembled, and reinforced, boxed in and tied into the chassis of the power head.

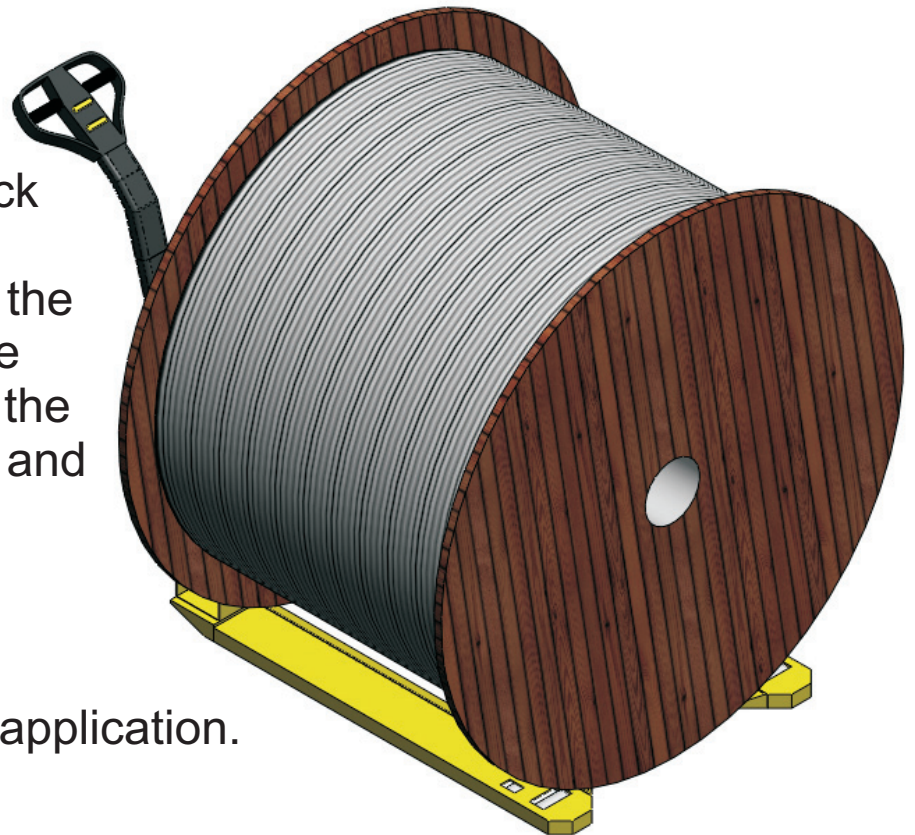

The unit is complete with the forks set at the required width and the angle is set for the diameter of the rolls desired to be moved.

SUPERIOR ROLL HANDLER

This modification allows the customer to handle large diameter reels or rolls without the fear of the unit rolling or damaging the product.

Modifications made to the truck include widening the forks to accept the roll or reel, adding the angles to the fork to cradle the load perfectly and reinforcing the linkage, battery compartment and the overall construction of the pallet truck.
